“Social Capital Formation for Supplying Local Community Services through Coordination of Social Economy, Local Governments and For-Profit Enterprises in Japan”

Hajime IMAMURA  
Toyo University, Tokyo

Abstract

Social Economy has been contributing to the supply of community business services in Japan in association with local government. However, organizations in Japanese Social Economy are rather weak in both of their financial and human resource foundations; furthermore, networking among social economy and local governments has several difficulties especially in utilizing the mapping of social capital endowment in their respective region.

This paper tries to investigate the contribution of Social Economy to retrieve the Social Capital in the Japanese local economy and society with some internationally comparative framework with European Social Economy. And, we analyze the main cause of skilled human capital shortage for the Social Economy in Japan while there is abundant accumulation of human skills in the for-profit sector. And, finally, we are trying to find out a necessary way to improve the level of social capital for the supply of life related community services in Japan.

Networking, Human capital, Social capital, Social economy, Local development, Incentive in Organization

1 Introduction

This is a preliminary paper for promoting intensive research of international comparison in social capital accumulation through the coordination of the activities of local government, for-profit enterprises and social
In this paper, I will focus on the incentive mechanism and human capital of the social economic sector and its network in the context of social capital, and I will also focus on entrepreneurship of diversified economic organizations from public, private for-profit and non-profit entities. The organizations, that are providing service of general interest in the relevant local district; coordinate individual incentives in various organizations through sharing the knowledge and experience across the border of profit or non-profit, and private or public.

The main focus of this paper is the role of social economy to social capital accumulation in Japan. More precisely, it is important to know how the social economy in Japan responds to the expectation for social capital formation as an alternative device to for-profit enterprises and local/national government. However, it cannot be achieved only by social economy alone, but the role of public authority to be one of the designers of social economic system in the local district is very important, more specifically, coordination skills of all kinds of supplier of the general interest services are required from public authority.

This paper is a combination of empirical statistical research and descriptive consideration of governmental organization. First, the original data used in this paper is from two questionnaires I had conducted, one is on incentive change after wage system reform in Japanese for-profit enterprises, and the other is on workers motivation and labor supply in the Japanese non-profit sector. Second, I have been studying decision making and human management system in Japanese public institutions providing services of general interest; Administrative Agency of Ministry of Health, Labor and Welfare, for several years as a member of an external evaluation committee.

Let me discuss that the most important point in this paper is to enhance the level of human capital in social economy. Human capital that is well informed and perceived about the mapping of resources (human, financial, managerial etc.) is very much important for the supply of service of general interest. It will be obtained through sharing and exchanging the entrepreneurial human capital among different organization.

My tentative proposition for that is to overcome the Asymmetry of information, Asymmetry of human capital, Asymmetry of entrepreneurship among different sectors. The key role for conquering this asymmetry is to enhance the level of social capital through increasing chances to set up consortiums or partnership to share the common but flexible skills to manage the supply of services of general interest in the local district.

However, changing social coordination system may not be easy if we consider social differences among countries. For example, it is not an easy way for Japan as an Asian country with different cultural and historical experiences from other developed countries in Europe and North America. It is the country which has once succeeded in its economic growth and built up unique combination of employment and social security system linked to the labor management of individual enterprises.
More precisely, most of the economic resources are too much integrated into private enterprises so as to compete efficiently with competitors in international markets and less to social economic sector. And, those systems are originated from the war time resource mobilization policy in the period of World War II. And, it is especially important to remark that the local community of Japan had also designed to support the war time mobilization system for monitoring and managing local district.

Hence, as I wrote at the beginning of this section, this paper itself is an introduction to the international and inter-disciplinary research project composed from combination of hypothesis to analyze the possible mechanism behind Japanese social economy to withdraw the possibility of its own future.

2 Losing Japanese social capital in industry and local community

Once they maintained high economic growth in Japan, the social capital in Japan is decreasing significantly in industries and local communities.

According to the Japan Productivity Center for Social and Economic Development (JPC-SED), the “trust” in Japanese workplaces is decreasing, -22% for executive managers, -17% for colleagues, compared to the beginning of 1980’s. And, by another research conducted by the same institute at 2007, it shows us that the mental diseases, such as depression and insomnia, are increasing in 47.7% of the local government in Japan from 2005 to 2007. In addition, 52.5% of the local government reports that “the chances of communication among officers are decreasing” and 48.8% of them recognize that “the chances of mutual assistance within workplace are decreasing”. Furthermore, there are significant correlation between the percentages of mental disease and the decreasing mutual assistance among officers. The report insists one of the reasons behind that; 82.3% of the local governments feel “the community people become more demanding and stricter to the services from local government”.

The Japanese employment system has altered significantly in its component of roles. Japanese workers life had been supported by fringe benefits of for-profit enterprises. Employees livelihood was mostly dependent on the Japanese employment system which had been included certain part of the social welfare systems, like housing allowances, house wife allowances, child raising allowances etc. Hence, the Japanese employees have been demanded strong commitment to their enterprises in exchange for many fringe benefits. Consequently, long working hours with unpaid overtime work are accepted while hours of husbands for child care and local community activities are decreased.

We may say that we have accumulated a high level of individual human capital and a kind of social capital for coordinating persons and organizations, but not in local communities or child raising families.
Under present global economic competition, for-profit enterprises are cutting labor cost by abolishing fringe benefits and introducing non-regular employees by substituting regular employees. The Japanese middle class has decreased their percentage; instead, new poor classes working in unstable conditions have increased their percentage. Then, one result is that Japanese individuals and families have found shortage of general social interest services in both enterprises in which they are employed and local communities where they live.

As long as Japanese enterprises are struggling to survive in a climate of global competition and government holds a huge amount of budget deficit, we have to find an alternative solution; however, Japan is now at a very low level of accumulation in both human capital and social capital for providing social general interest services in local community.

Our crucial question is whether we can promote the social enterprises or social economy with the coordination of local government as a substitute to traditional Japanese types of combined employment, and whether we can promote social welfare systems that are seen, especially, northern European countries.

3 Organizations in the Japanese for-profit enterprise sector

3-1 Abundant accumulation of human skills in Japanese enterprises and asymmetry of endowment

Japanese life-time employment system that had worked as an efficient human capital accumulation device at very high cost on labor management systems could not have survived without major restructuring.

Because, job mobility is increasing necessary skills are also changing rapidly. Needed skills are changing; from collaborative and team working skills, to more independent decision making through own development of specific skills and personal networking of business partners and so on. Inequality in distribution among individuals of these skills is expanding, and a serious problem is that these variables have good explanatory power pertaining to income distribution.

Skill transportation can take by the mobility of skilled workers among different organizations, for example, accounting, marketing, human management and so on. Like flower seeds are transplanted by animals, multi-experienced human capital will be diversified into different economic organization. A Basic skill training programs for younger generations to promote their ability to live in community or society (Social basic manners, communications skills, problem solving ability etc) by Ministry of Economy Trade and Industry (METI), and Ministry of Health, Labor and Welfare (MHLW).
Social Capital Formation for Supplying Local Community Services through Coordination of Social Economy, Local Governments and For-Profit Enterprises in Japan

Even for the entrepreneurship, it is necessary to be transplanted in local district. It is because the concentration of entrepreneurship to the private for-profit sector is also found in local economy. In local power families, especially the owners of small enterprises or certain amount of land owners in province, they are enthusiastic for seeking chances for profit making, and they are very eager to promote their entrepreneurship and management skills. More importantly, their idea is not always mercenary in the idea of profit making, because they are living in a local community and having local human relations.

We must remember this asymmetry of human capital accumulation between for-profit and non-profit sector when we discuss about labor supply for non-profit organizations or social economy in Japan.

3 - 2 Japanese changing employment system in for-profit enterprises

In the middle of 1990s, suffering from the economic recession, many Japanese enterprises decided to introduce a performance based wage system under the strong pressure to save the labor cost and make it more flexible. However, as far as labor incentive is concerned, this wage system reform had negative effect on Japanese for-profit enterprises. According to our questionnaire to workers who had experienced wage system change in Fig.-1, 38.5% replied that their morale to work had decreased, and only 11.2% replied it had increased (Imamura (2005)).

Looking at more precisely the result of wage system change, it is apparent that we had considerable loss of reliable and cooperative attitude among employees. In Fig.-2, there had been positive effect, for example 74.3% had answered “Sense of responsibility and motivation to achieve target are increased”, and 47.1% responded “Job description, responsibility and performance target is made clear.” However, this is only within 11.2% of the workers who had positive evaluation to wage system reformation.

In Fig.-3, the precise effects on the workers who evaluated the wage system reform negatively are shown.

Increasing atypical employment in for-profit sector and employment opportunities in social economy in Japan

In addition to the incentive problem, we should refer to the working condition problem of atypical workers in recent Japanese economy. Helped by several de-regulations in labor law, especially in dispatched workers and contractual workers, Japanese for-profit enterprises had succeeded in reducing labor cost through augmenting percentage of atypical workers. Moreover, working conditions of workers in the social services market in which many non-profit organizations are competing with for-profit organizations, for example, care workers are mainly consisted from temporary non-regular employment. Many of them are dispatched workers.

Consequently, the social divide between the over- and under-employed is increasing. Younger generations will be faced with insecure prospects for steady employment. Contrary to emergences of bi-polar divide of employment, fortunes are being made by those who own the patents on technological innovations, highly skill in operating in financial markets, and so on. As a result, the employment opportunities of social economy in Japan became one of the interesting choices for unemployed people. Therefore, quality of employment becomes one of the most important points of view when we analyze the future of employment opportunity in social economy.

Employment in social economy as alternative choice

Emerging social economy in Japan and labor supply for the non-profit organizations

As an alternative to for-profit industry sector and local government, that seems to have been decreasing its social capital, NPOs as one of the important components of the social economy in Japan shows some positive contribution for social capital accumulation

The employment opportunity in NPOs has become one of the important alternatives to those of for-profit or public organizations. Under the changing condition of increasing atypical employment, the percentages of part time worker, dispatched worker or contractual worker are distinctly increasing. For those atypical employment opportunities, various applicants in their different life or career stages are coming and getting jobs. That is; female workers once quit their job when they get married or pregnant, retired men after their mandatory retirement newly graduate who had difficulty for finding regular employment, and so on.

Various kinds of non-profit organizations including social economy have been playing an important role
for providing flexible employment opportunity that fits to individual needs of labor supply in different life stages.

4.1.1 Highly motivated workers with the explicit social mission that composes social capital.

It may be possible to say that the workers in NPO are highly motivated with its mission, and they understand very well about the significant importance of mutual cooperation between members. Looking at Fig.-4, their motivation is mainly coming from feeling of contribution to a social missions, sympathy to the activity, and recognition of necessity of NPO activity. More than 40% of the members of NPO agreed to these three motivations.

Besides motivation to attend NPO activity, they are rewarded by what is not obtainable in other organizations. Above all, 56.9% replied to the work in NPO is challenging or worthwhile to do. And “interpersonal relationship” comes for the next at 32.3%, and then “Freedom of work” as 31.9%. We may conclude from that there is apparently the trust among members and incentive to group working in NPO in Japan, most of them are drastically decreasing in for-profit sectors (Fig.-5).
4.1.2 Human resources relied on the support from another family members

Main work force supporting non-profit organizations and workers cooperatives are mainly house wives and retired person. In contrast to declining number of housewives, retired persons are increasing. But they are not well trained in a non-profit ways of working with missions for social contribution. The people coming from private for-profit sectors are only gotten used to profit making competition, and non profit organizations have not their own training system in their own organization.

Moreover, most of the members are female and middle and old aged people. For example, in Imamura (2005), the percentage of female members in NPO and workers cooperatives in Kanagawa prefecture in Japan, is 60.0% and 97.2% respectively, as for age composition, percentage of member aged more than 50 years old are 66.5% and 52.1% respectively.

Furthermore, even if those NPOs and workers cooperatives contribute to enhance the social capital level, future of those organizations is not necessarily hopeful. Because, they had been relied on the human resources supported by another member of family, as shown Fig.-6, only 16.9% of the workers say the earnings from NPO is the main source of income. 37.3% works only for social contribution not for income. That is, they are not principal earner of family. But more women tend to have economically independent employment like full time employment, and then the labor supply for the non-profit sector is declining, so it would be at least serious constraint of expansion of this sector.
4-2 Other problems in non-profit organizations in Japan

In addition to the labor supply structure, the managements of NPOs in Japan are not well organized and organizational foundations are far from stabilized. They are always suffering from “not enough payment” 30.4%, “manpower shortage” 29.6% and “insufficient social security” 27.3%. It must be remarked that the employment condition and management foundations have to be improved (Fig.-7).

- Leisure cannot be taken: 10.0%
- The social security is insufficient: 21.3%
- Training and induction course are insufficient: 7.3%
- The organization is uneasy because of management insecurity: 19.6%
- Others: 11.9%
- Unanswered: 20.8%
4.2.1 Human resource foundations in Japanese non-profit organizations and Skilled human capital shortage

Entrepreneurial skills are different among different organizations. Not only to manage one organization, but to coordinate the consortium of public, private profit and private non-profit suppliers. Especially the new type of human capital that can well coordinate the organizations to social goal under the practical experience and knowledge are necessary. And of course families and communities in the local area should be included even for the supplier of labor and entrepreneur.

New skills of social entrepreneurship will be required of many in the new configuration of society, in which a vast network of organizations within which many group and individual needs will be met throughout the coming years.

Referring to Rifkin’s “End of work”, we are facing with inadequate stability of work and “bipolar” divide of income inequality. We need some intermediary employment opportunities that are created by entrepreneurship with experiences in both profit and non-profit organizations.

Japan is now far behind in accumulating Social Capital, because for example the Ministry of Economy and Trade and Industry (METI) began to propose to enhance “basic social skills” among younger generations. It is because we feel there is a serious shortage or such skills among younger generations in Japan. Such situations like “NEET” or “free-ter” (part-time working young people) are not adequate to let them acquire such socially necessary skills.

NPO will not welcome retired people from for-profit enterprises, because their discipline is completely different and will not contribute to the organization. For example, if one very efficient accounting specialist retired from private for profit enterprise joined NPO, his (her) too much efficiency oriented skill and experience often raise conflict with NPO culture. This is the reason why we should prepare some introductory training process for the people moving from for-profit sector to NPO.

At the intersection level of market competition, we need a certain amounts of market oriented skills to utilize and organize competitive service supply. However, individual economic entities have its own mechanism to motivate them, and it is difficult to define which activity is public and which is private. Many activities are very similar. What is public and what is private is defined by source of money or human capitals working is paid by public or private funds.
5 Social capital in social general interest services

Whether the private for-profit entrepreneurship or non-profit entrepreneurship, the goal is to maximize the utilization level of factors endowed in that specific local area. Some type of consortium even among different disciplined.

Outputs of social economy integrate social results with indirect economic gains, for example the number of handicapped persons well cared for at home and not in hospitals; the degree of solidarity between persons of different age groups in a neighborhood.

To promote social capital in social economy or non-profit sector by government subsidies is, in fact, cost efficient, if it is well organized to invest to enhance the necessary human capital or social capital in the field creating general interest services and employment.

Social capital investment is needed for economic growth and stabilization of economy. If I may be permitted to use broader terminology of social infrastructure, social capital investment is very much crucial point if we discuss about the social investment and economic growth. There are two aspects, one is augmenting labor productivity of production at macro level, and the other is enhancing the quantity and quality of social services at micro level point of view.

5-1 Who knows the mapping the factor endowment for local community services in the region

We have to watch carefully the difference of work incentives among these institutions, and the idea of lifetime employment is now decreasing. That is, skills and experiences relating to organization, more diversified organization specific, that means multiple organization skills are needs. We can interpret it as some sort of “social capital” in each (local) economy.

It is identified that social entrepreneur as one who has developed substantial “map-making skills” and can navigate the “cracks between systems”

5-2 Enhance the level of social capital for the supply of life related community services

Enhancing the level of social capital at a local level may make general social services to be supplied more. Each type of organization has its own incentive, governmental, for-profit and non-profit.

If we consider the quality of services, non-profit nature of organization receives good reputation and reliance of providing high standard of safety and quality. So, to keep the general social objects that are not
quantified in terms of money, non-profit structure is preferable.

6  Coordination of governmental policy and local community initiatives

6-1  Local government

Public authority should coordinate the supplier of both general economic interest and general social interest in the local area. Design ability is needed by local public authority for coordinating and synchronizing the supply of locally needed services.

Public, Profit and Non-profit have their own entrepreneurial goal and never converge into a similar goals. Especially for the human capital or human network (I may say it as one kind of social capital) required to each organization are different. Each organization has its own competence in their field.

Public authority coordinates the interaction among public, private for-profit and private non-profit. The role of public authority is not to monopolize the supply or compete seriously with private for-profit enterprises, but to enhance the level of human capital for networking the factors to provide services required for local development.

6-2  Enhance the level of human capital for networking the factors to provide services required for local development.

It is necessary to explain the case of Yokohama case as a failure of coordination of government and social economy.

There are many examples for the Japanese bureaucratic management system doesn’t match the social economy type society.

The point is that three types of organizations should not contact at a personal level but at an organizational level as a whole, otherwise the real human capital preserved at organization cannot be utilized.

The complex of supply mechanism will never be realized without accumulation of human capital acquired from different disciplined organization, such as local government and non-profit organization.

The case of Yokohama is a rather advanced case of accumulation of social capital, because there are comparatively high levels of human capital will help motivate young people to join society. However, government couldn’t catch the accurate function of each factor in the region. Only for the reason that there are several organizations of government or non-profit for supporting youth social insertion, Ministry of Health, La-
bor and Welfare decided to shut down Yokohama Young Job Spot (YYJS) and stopped to distribute the budg-
et money for the YYJS.

Most of the supporters are members of NPOs in the youth supporting activities. Although the document in
Ministry of Health, Labor and Welfare (MHLW) explains it as “to make an accent in budget distribution
among Young Job Spots all over Japan”, however there were still many young people and their families sup-
ported in YYJS. Accordingly, the supporters of YYJS from NPOs decided to finance the YYJS by themselves,
and found financial resources for this, and succeeded to re-open it in the same place only the name has
changed as “Yokohama Young Job Square”.

The basic problem in this case was that the government didn’t care or maybe didn’t know what factors of
non-profit sector were connected to their policy.

7 Necessity of center integrates research, information and training in Social
Economy - Exchanging and movement of human resources among for-profit,
government and Social Economy -

7 - 1 Local government as a coordinator of supplying local community business

To share the profound knowledge to promote local development and flexible management for supplying
locally needed services in each type or organization is very important. Not only in case of an explicit consor-
tium but in case of independent transactions for service supply they can lower the transaction coat for sup-
plying local services.

7. 1. 1 Idea of “coordination” among those three sectors

It is better to create a pluralist society, which balances rights and responsibilities, when the very base of
public support for the needed. Public authorities should let human resources easy to cross the border of profit
and non-profit. That includes re-organization of a social security systems to be transportable not only among
enterprises but among different economic organization (Fig.-8).

For that purpose, especially in Japan, it is urgently necessary to set up the center to accumulate and ex-
change the factor endowment; human capital, financial resource, evaluation of social enterprises, need for
community businesses, management skills, legal procedure, and so on.
Fig.-8 what is necessary to support NPOs

Under the changing situation, it is apparently necessary that the national government and academic society for social economy should take an initiative and set up financial and legal bases for the functioning central organization to integrate and distribute the resources for accumulating social capital in every region all over Japan.

The most necessary and easy way to enhance the level of human and social capital in a social economic sector in Japan is to set up an inter-sectoral unified center for promoting and expanding the network of individual organizations more easily.
